EXPERIMENT – 4B

ADVANCED DATA MODELLING AND FORM DESIGN

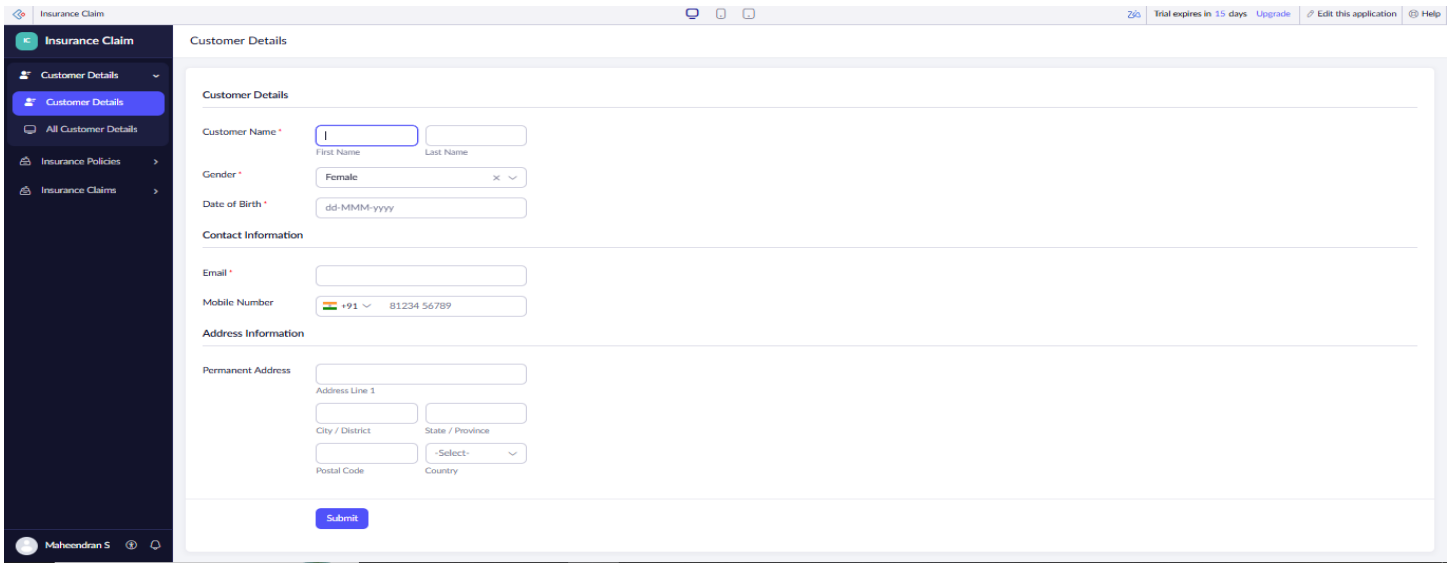

Aim

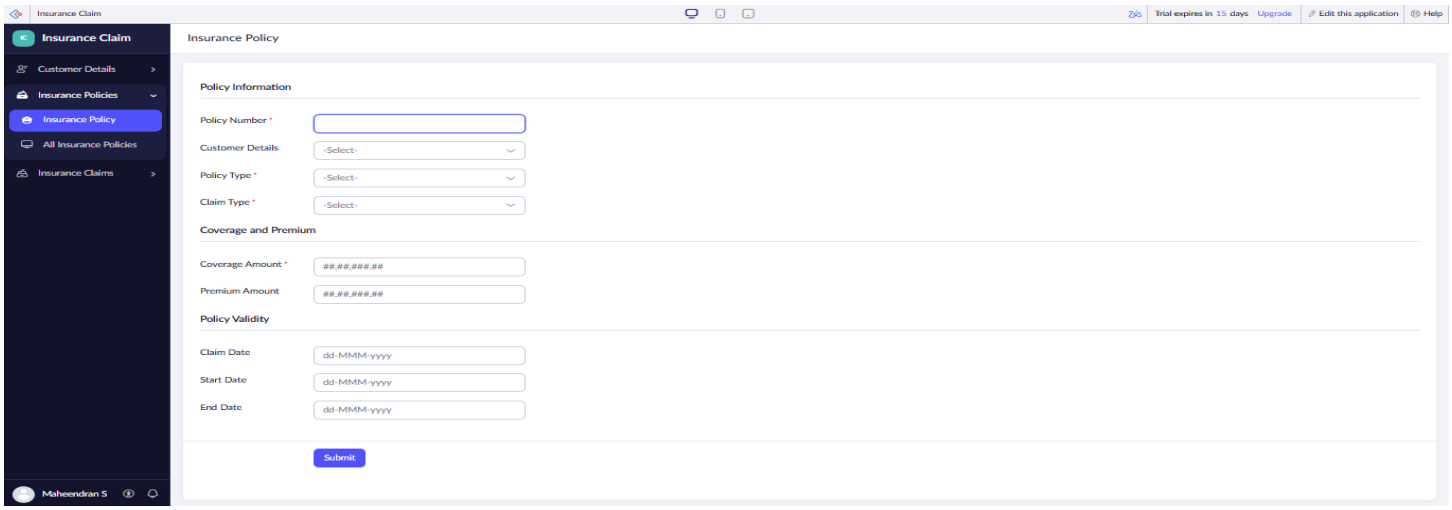

To design and develop an Insurance Management Application using Zoho Creator with advanced data modelling and form design by creating Customer Details, Insurance Policies, and Insurance Claims forms, establishing lookup relationships, validating customer-policy relationships, and organizing form fields into appropriate sections.

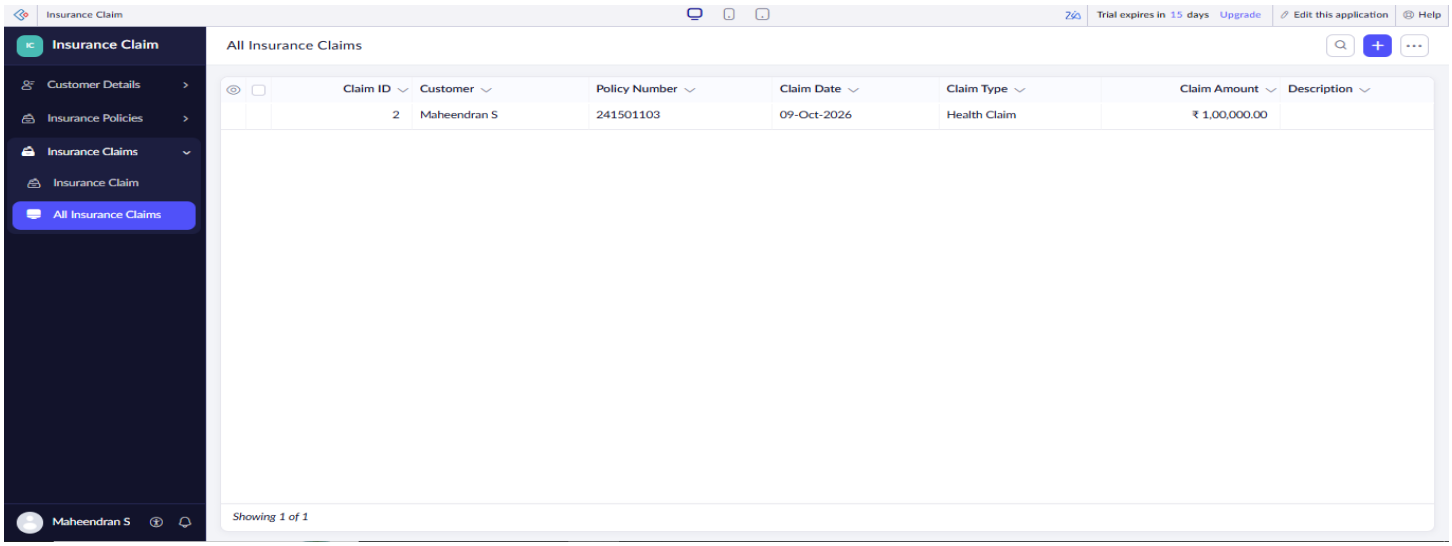

Algorithm:

1. Start.
2. Create the Customer Details form to store customer personal, contact, and address information.
3. Create the Insurance Policies form to store policy details, coverage, premium, and validity dates.
4. Create the Insurance Claims form to record claim details, amounts, supporting documents, and claim status.
5. Establish lookup relationships between Customer Details, Insurance Policies, and Insurance Claims.
6. Configure a validation workflow to ensure the selected insurance policy belongs to the selected customer.
7. Organize the Customer Details form into Personal Information, Contact Information, and Address Information sections.
8. Organize the Insurance Policies form into Policy Information, Coverage and Premium, and Policy Validity sections.
9. Organize the Insurance Claims form into Customer Information, Policy Information, and Claim Details sections.
10. Configure the claim status default and maintain the existing email notification workflow.
11. Test the forms, lookup relationships, validation, and email notifications.
12. Stop.

OUTPUT:

RESULT:

Thus, the Insurance Management Application was designed successfully using Zoho Creator. Advanced data modelling was implemented through lookup relationships and customer-policy validation, and the forms were organized into logical sections for improved usability. The existing claim submission and email notification workflows were tested successfully.
